Our project is based on **Job Portal Management**. The project consists of 3 modules :

1. Applicant

2. Employer

3. EXIT

In the **Applicant Module**, you can have 3 options i.e.

I. **Register Yourself**:

In this option, the user can register himself/herself by entering their AADHAR NO., NAME, AGE, GENDER, EMAIL and PHONE NO.

II. **Recruitment**:

In this option, the user can browse through a list of different companies and recruitment options sorted according to the applicants qualifications and requirements.

III. **Services Available**:

In this option, you will get the list of services available on our portal such as:
   a) To modify user data:
      In this option, you can change/modify the registered details given by applicant.
   b) To provide help to new users:
      In this option, new users are provided guidance from FAQs and general queries.

In the **Employer Module**, you can have 4 options i.e.

I. **Register Company**:

In this option, the user can register his/her company by entering their COMPANY NAME, ADDRESS, CATEGORY and CONTACT INFO.

II. **Recruitment**:

In this option, the user enter job requirements for the company and can browse through a sorted list of interested applicants based on their requirements.

III. **Appointment:**

In this option, the employer can single out of his/her desired applicants and decide future appoints with them. They can also share this information with the applicants via email.

IV. **Services Available**:

In this option, you will get the list of services available on our portal such as:
   a) To modify company data:
      In this option, you can change/modify the registered company details given by employer as well as the requirements setup by them.

In the last and final module i.e. **EXIT MODULE**, user can end the program.
